

The RP-6 is a control processor and the heart of this control system. It provides IR, RS-232 and relais control ports for all devices in the home cinema. The RP6 has a connection port for RTI inwall control panels (e.g. RK2) and for the RF antenna (RM-433), which can be addressed by any RTI handheld control panel (e.g. T2C). All system commands and device status are stored on the RP-6. This ensures the secure and comfortable control of the system with two independent control panels.

All the connected equipment is managed by the two control panels RK2 and T2C. According to scenarios in a home cinema, the equipment will be controlled automatically. This means, simply press one button and the show starts. The projector turns on, the screen comes down, the light dims and the movie can begin. When the system will be switched off, everything goes the opposite way, but the cooling down time of the projector will be considered, before the control system really turns off the projector.

## Features:

- Complete room control:  
Room- and mediaequipment is completely integrated
- Flexibility:  
Mobile (RF) and fix mounted (wired) control panels in one system
- Reliability:  
System commands and device status are stored on the RP6
- Comfortable:  
Macro feature enables to combine different commands for different equipment in one button press
